

SYSTEM FOR MANAGING OBJECTS BASED ON POSITION DATA**ABSTRACT**

A management system that identifies a position of each machine, article, or the like to be managed and displays the position so that a maintenance worker can manage data about such machines efficiently. A management system is configured by a host computer that holds a database for machines to be managed, and a terminal used to receive the latest database for such machines periodically from the host computer. The terminal searches for a target machine in the database and displays a position of the target machine on a floor map displayed on the display device. The database is managed by the host computer. The database may also be provided with an editing application program used to edit each apparatus mark to be displayed as the position of a target apparatus on the floor map.
